

# Healthcare for the future

## CORPORATE PROFILE

### WHO IS HEALTHCARE FOR THE FUTURE?

Established in 2016 by a team of young, passionate executives who knew that they could make a difference, non-profit organisation Healthcare for the Future was founded in order to bring significant, impactful and life-saving healthcare-related services to previously disadvantaged South Africans, providing access to better care and more sophisticated screening technologies, as well as improved education on infections.

Healthcare for the Future believes that every person has a right to high-quality healthcare. Without one's health, there is no quality of life, no family, no home and no community. The longevity of our fellow South Africans is what we believe contributes towards a more sustainable, healthy, thriving economy.

The vast experience and proven capabilities of Healthcare for the Future's founders span a range of specialist areas of expertise, from telecommunications and project management to healthcare and disease management services. The dynamic fusion of this knowledge into one passionate team, along with its access to the latest technologies, molds Healthcare for the Future into an NPO you can trust.

Healthcare for the Future will soon be fully B-BBEE compliant, operating on the basis of impacting communities and saving lives. With the ability to execute measurable and trackable projects, whilst providing engaging reporting structures, Healthcare for the Future will also give South African companies a tax-deductible incentive to make a significant difference.

## WHAT DOES HEALTHCARE FOR THE FUTURE DO?

Healthcare for the Future has the ability to execute incredible healthcare related projects and initiatives, including but not limited to:

1. The latest disease screening services – easy, self-sample medical tests that provide communities with access to testing, treatment and information on the prevention of disease.
2. Digital doctor consults – specialists such as GPs, pediatricians, counselors and dieticians can provide online consultations to those who don't have physical access to doctors.
3. The ability to send nurses into communities on a regular basis – providing regular care where normally there is very little. This includes the sourcing, education and training of nurses to provide higher quality healthcare and screening services for the early detection of disease to disadvantaged South Africans in their local community.
4. To facilitate treatment and support services where infection is detected in order to guide communities towards better health.
5. The ability to sponsor and help smaller, well established clinics in poorer areas with primary healthcare screening services and support.
6. Disease management and compliance – the option for people taking antiretroviral (ARV) drugs for example to be assisted by a disease management programme, providing the tools for better health and the ability to fight disease.

## HOW CAN THIS BENEFIT SOUTH AFRICAN COMPANIES?

- By making a significant, tangible, life-saving difference to communities.
- By putting funds towards projects and initiatives driven by an ambitious, passionate and goal-orientated team.
- By soon contributing towards a valuable tax-deductible cause.
- By building brand loyalty and trust within the community.
- By marketing the results and success of healthcare projects and initiatives, in and outside of the community.
- By soon being able to improve a company's B-BBEE rating and score through contributing towards black communities across South Africa.
